A reminder for participants in Grading 2.0
Join our webinar 12th February for sneak peeks and what's coming next for annotation and feedback.

In this release note

- Heads up
- New features
    - Inline Gap Match
    - Graphic Text Entry
    - Invigilator instructions
    - QTI 2.1 import and export
- API
    - Update to Webhook notifications
    - Submissions API with external deliveries
- Improvements and bug fixes

Have a great weekend!

The Inspera Team

Heads up

The new option in Monitor called *Grade verification* (For Appeals) will be made available during the next couple of weeks. The purpose of grade verification is to support administrative grade control, so that results can be made visible or kept hidden from the Inspera API.

For latest updates on Appeals, visit [Klagesensur i Inspera Assessment](#) (Norwegian).

Release of the new question type *Graphic Gap Match* has been postponed to 1st March 2019. During testing we found that the authoring workflow needed some optimisation.

We apologise for the delay.

New features in Author

Inline Gap Match

Automatically marked. Included in all plans. Requires activation.

[Inline Gap Match](#) allows authors to create text-based questions with a dynamically created token bank of correct answers. Correct answers can be either plain text, rich text, mathematical equations or images.
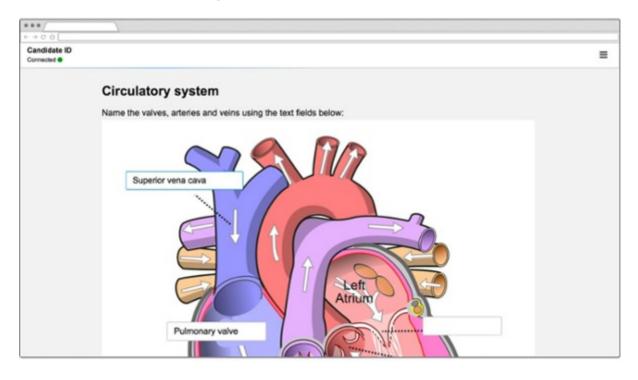

[Learn more in Inspera Knowledge base](#)

Graphic Text Entry

Automatically marked. Included in all plans. Requires activation.

[Graphic Text Entry](#) allows authors to create visual Text Entry questions. As opposed to the existing [Text Entry](#), input fields in a Graphic Text Entry question are positioned on top of a background image. In all other aspects Graphic Text Entry is authored, answered and scored in the same way as regular Text Entry questions.

## Import and export Question Sets in QTI 2.1 format

It is now possible to import and export Question Sets in QTI 2.1 format. We have also improved the validator that checks your QTI Assessment Items to determine whether they adhere to the QTI 2.1 specification.

New features in Deliver

Invigilator instructions

Included in all plans. No activation required.

The purpose of Invigilator instructions is to allow planners to include information to invigilators and chief invigilators when setting up a test.

Highlights

- Invigilator instructions are visible to Planners, Chief Invigilators and Invigilators
- Add your Invigilator instructions to Templates, to save time later.
- Planners can replace instructions at all times, during the test life cycle.

Inspera API

Update to Webhook notifications

Up until this release, webhook notifications required the receiving user to have a direct link to the context object on which the event occurred. Based on user feedback we are making it so that users that have extended access will receive a webhook notification for all objects, regardless of whether or not the user has a direct link to the object. Notifications will still only be sent on event types for which the user has explicitly subscribed.

Submissions API now includes external deliveries

The submissions API now includes any external deliveries attached by an administrator. External deliveries are included under the 'ext_inspera_externalDelivery' field.

Improvements

- Print Manager: Support for multiple questions pr page while keeping page breaks pr question

Bug fixes

In this release we have spent some extra time exterminating bugs. Here are some of the more notable ones:

- Fixed an issue where the wrong time zone was used when displaying grading deadline and upload time in some cases.

- In rare cases stimulus documents that was added to a Question Set were not shown correctly in the authoring tool. This has now been fixed.

- When authoring questions with inline images, pasting text into the question could cause the image to be removed. This has now been fixed.

- Fixed an issue where keyboard navigation was not behaving as intended when using vertical sections.

- Fixed an issue where names containing characters outside of the latin alphabet were not shown correctly when used as sender name on notification emails.

- In some cases setting up an externally synchronized test using templates and non-anonymous candidates could lead to a mix of anonymous and non-anonymous candidates. This has now been fixed.

- About 40 other bugs got squashed in this release.

In addition to the user facing changes we announce in the release notes, we are always working on improving the technical components that make up Inspera Assessment. One of the areas we have been focusing on lately is decoupling even more parts of the system. This is enabling us to make bigger changes to the system without requiring full downtime. An example of this is the deployment of this release, where we paused student delivery and some indexing functionality while we completed required updates.
